Open-loop set-point drift: one premise → seven constraints
Force of selection
→ 0 after reproduction
(Hamilton 1966)
No SELECTED target for
post-reproductive state
Homeostatic loops
run OPEN-LOOP
Developmental/growth program
CONTINUES un-decremented
(quasi-program; drift b>0)
C2 Gompertz +
late-life plateau
C3 species dial
(loop-closure length)
C4 hallmarks =
correlated readouts
C5 signaling-lowering
re-imposes set-point
C6 reprogramming
rewrites reg. state
Antioxidants act on BYPRODUCTS,
not the control error → ITP 0/8 extend LS
(discriminates vs. free-radical theory)
Held-out prediction: restoring the regulatory
INPUT rescues function at FIXED epigenetic clock
+ FIXED damage — no rewriting, no repair.
Splits drift from information-loss & damage
(not from hyperfunction: sibling)
